

"Не согласен - критикуй, критикуешь - предлагай, предлагаешь - делай, делаешь - отвечай!" Сергей Павлович Королёв

"If you don't agree, criticize; if you criticize, suggest; if you suggest, do it; if you do it, take responsibility!" Sergey Pavlovich Korolev

On the positive role model for government structures.

Structural functionalist theories often view government as the **control system**—the *brain* of society—adopting a holistic perspective in which society functions as an *organism*. However, this perspective **aligns more closely with** social parasitism, where the governing body exploits the rest of society.

Instead, such structures are better understood and organized **as the skeletal system**—a **supporting framework** that enables natural growth and facilitates **adaptive flexibility**. For example, structural and external protections for vulnerable cells and organs (**e.g.**, bone marrow fostering the growth of new cells or the spinal cord facilitating communication) provide a regulatory framework **during the development of** embedded, **non-self-regulating** agents or societies.

The *brain*, in contrast, is better conceptualized **as an informational-intelligence parasite**—a **model-generating engine** that can function symbiotically. **Used constructively**, it fosters higher levels of **complexity and coherence** in cooperative models, extending across **spatial and temporal dimensions** beyond individual agency while avoiding **descent into** chaos. **However, when misused**, it produces propaganda, **manipulative narratives**, and parasitic models that inevitably lead to **systemic decay**. This **inevitably** results in **a collapse back to previous** levels of complexity due to **intrinsic conflict generation**.

The greater the system's **decoherence and complexity**, the deeper its **eventual collapse**.
